Interventions in Aging: Understanding mechanisms and the promise of extending human healthspan

Feb 2-7, 2015, Cancun, Mexico

A plethora of genetic, dietary and pharmacological interventions can extend healthy lifespan in laboratory animals, and can delay or ameliorate diverse aging-related diseases. Many of the signalling pathways involved are evolutionarily conserved, and are starting to be implicated in human aging. This raises the intriguing possibility of performing preventative medicine against the chronic diseases of our time by targeting the main risk factor for all of them, namely aging. Two important current challenges in the field are (1) to understand the downstream pathways by which longevity interventions combat age-related loss of function and pathology, and (2) to translate the findings into the extension of human healthspan.

2nd Interventions in Aging Conference

Fusion Conferences Ltd.

March 2-5, 2017, Cancun, Mexico

Chairs: Prof. Linda Partridge (University College London) and Dr. Brian Kennedy (Buck Institute for Research on Aging). A plethora of genetic, dietary and pharmacological interventions can extend healthy lifespan in laboratory animals, and can delay or ameliorate diverse aging-related diseases. Many of the signalling pathways involved are evolutionarily conserved, and are starting to be implicated in human aging. This raises the intriguing possibility of performing preventative medicine against the chronic diseases of our time by targeting the main risk factor for all of them, namely aging. Two important current challenges in the field are (1) to understand the downstream pathways by which longevity interventions combat age-related loss of function and pathology, and (2) to translate the findings into the extension of human healthspan.
